

WEB BROWSER-BASED OBJECT ORIENTED APPLICATION COMPONENT TEST CLIENT

ABSTRACT OF THE DISCLOSURE

- 5 The universal, Web browser-based Enterprise JavaBean (EJB) test client is itself
a Java 2 Enterprise Edition (J2EE) application packaged in a Web archive file. This
archive, when extracted, consists of a set of files that are installed on a target
application server. The installation makes it possible for a user of a Web browser on a
workstation remote from the application server to perform a number of tests on, and
10 invoke, methods in EJB beans that are installed on the staging, or even production,
servers. It is also possible to perform tests in real time under real conditions.
